/note="Vector: pBRcDNASfiAB; The library was constructed
from 10 different sources of RNA from a single genotype.
Separate cDNAs were generated using primers that
incorporated unique 5' and 3' tags to distinguish each
source of RNA. CDNAs were then pooled, size-fractionated,
directionally cloned into a custom medium-copy vector and
transformations made with four size classes to minimize
size blas. Details of each source of RNA and library
construction can be obtained at http://cgpdb.ucdavis.edu/

http://ccR-081.mit.edu/GENSCAN.html), GeneMarkHWM (Mark Borodovsky, http://genemark.biology.gatech.edu/GeneMark/), GlimmerA (a variant of GlimmerM, see Minaela Pertea.
http://www.tigr.org/softelab/glimmerm.html/glimmerm.html, and GeneSplicer (Wihaela Pertea and Steven Salzberg, contact mperteadrigr.org), searches of the complete sequence against a peptide database and the plant EST database at TiGR (http://www.tigr.org/tdb/tgi.shtml). Annotated genes are named to indicate the level of evidence for their annotation. Genes with similarity to other proteins are named after the database hits. Genes without significant peptide similarity but with BST similarity are named as unknown proteins. Genes without proteins over most of their length are annotated as hypothetical proteins. Genes encoding tRNAs are predicted by transcription programs over most of their length are annotated by transcription proteins. Genes encoding tRNAs are predicted by transcription proteins. Genes encoding tRNAs are predicted by Location proteins are identified by repeatmasker (Arian Smit, http://ftp.genome.washington.edu/RM/Repeatmasker (Arian Smit, http://ftp.genome.washington.edu/RM/Repeatmasker (Arian Smit, http://ftp.genome.washington.edu/RM/Repeatmasker (Arian Smit, http://ftp.genome.washington.edu/RM/Repeatmasker (Arian Smit, http://ftp.genome.washington.edu/RM/Repeatmasker (Arian Smit, http.//ftp.genome.edu/RM/Repeatmasker

Genes were identified by a combination of several methods: Gene prediction programs including Genscan+ (Chris Burge, http://CCR-08.mit.edu/GENSCAN.html), Genemark.biology.gatech.edu/dLML), Genemark.biology.gatech.edu/dLML), Genemark.Bordovsky, http://genemark.biology.gatech.edu/dLML), Genemark.Bordovsky, http://genemark.biology.gatech.edu/dLML], GilmmerA (a variant http://www.tigr.org/scfilab/glimmerA.htm/glimmerA.html, and GeneSplicer (Mihaela Pertea.and Steven Salzberg, contact mperteagetigr.org), searches of the complete sequence against a peptide database and the plant EST database.ar TIGR (http://www.tigr.org/tdb/tgl.shtml). Annotated genes are named to indicate the level of evidence for their annotation. Genes with shinlarity to other proteins are named after the database hits. Genes without significant peptide similarity-but with EST similarity are named as unknown proteins or EST similarity but with EST similarity are named as unknown proteins over most of their length are annotated as hypothetical proteins Genes encoding tRNAs are predicted by tRNAscan-SE (Sean Eddy, http://genome.washington.edu/mk/RepeatMasker.html).

Simple repeats are identified by repeatmasker (Arian Smit, http://ftp.genome.washington.edu/mk/RepeatMasker.html).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         LLQQAEPAIVAATGTGTIPANFSTLSVSLRSSGSTLSAEPSKSVPLYGALGLTHHQYD

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  mRNA
                                                                                                                                      CDS
mperteagligr.org), searches of the complete sequence against a peptide database and the plant EST database at TIGR (http://www.tigr.org/tdb/tgi.shtml). Amnotated genes are named to indicate the level of evidence for their annotation. Genes with similarity to other proteins are named after the database hits. Genes without significant peptide similarity but with EST similarity, are named as unknown proteins. Genes without protein or EST similarity, that are predicted by more than two gene prediction programs over most of their length are annotated as hypothetical proteins. Genes encoding tRNAs are predicted by tRNAscan-SE (Sean Eddy, http://genome.wustl.edu/eddy/tRNAscan-SE). Simple repeats are identified by repeatmasker (Arian Smit, http://ftp.genome.washington.edu/RM/RepeatMasker.html).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           TA FAAI INREKETRWI ILSIIGSILIYVEGSPEFGGEPDENBEFYSIQAWLTFÄASV

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      * NOTE: This is a 'working draft' sequence. It currently consists of 4 contigs. Gaps between the contigs are represented as runs of N. The order of the pieces is believed to be correct as given, however the sizes of the gaps between them are based on estimates that have provided by the submittor.

* This sequence will be replaced
* by the finished sequence as soon as it is available and the accession number will be preserved.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 clones, alignment with available reference sequence (e.g., human), and/or confirmation by PCR testing. In addition, the sequence assembly is based on at least 8x average coverage in Q20 bases and has been reviewed to rule out gross misassemblies, the low-quality ends of sequence contigs have been trimmed away, and each base is associated with a Phrap-derived quality score.

The sequence data in this record represents an 'enhanced' version of a Phase 2 submission. Specifically, the indicated order and orientation of each sequence contigl has been established using one or more of the following: read-pair data from individual subclones, overlaps with neighboring clones, alignment with available reference sequence (e.g., human), and/or confirmation by PCR resting. In addition, the sequence assembly is based on at least 8X average coverage in Q20 bases and has been reviewed to rule out gross misassemblies, the low-quality ends of sequence contigs have been trimmed away, and each base is associated with a Phrap-derived quality score.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Sequencing vector: plasmid; n/a; 100% of reads Chemistry: Dye-terminator Big Dye; 100% of reads Assembly program: Phrap; version 0.990319

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           NOTE: This is a 'working draft' sequence. It currently consists of 25 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Contact: sequence submissions@genome.wi.mit.edu

abbreviations are used to associate primary accession numbers given in the feature table with their source databases: Em:, EMBL; Sw:, SWISSPROT; T:, TREMBL; WORMPEP; Information on the WORMPEP, database can be found at http://www.sanger.ac.uk/Projects/Celegans/wormpep This sequence was generated from part of bacterial clone contigs of human chromosome 9, constructed by the Sanger Centre Chromosome 9 Mapping Group. Further information can be found at http://www.sanger.ac.uk/HGP/Chr9 RPII-23B15 is from the library RPCI-11.1 constructed by the group of Pieter de Jong. Identifying a stress condition to which a plant cell has been exposed and producing plants with increased tolerance to these abiotic stresses.

Claim 144; SEQ ID NO 1034; 577pp + Sequence Listing; English.

The invention relates to identifying a stress condition to which a plant cell has been exposed, comprising a stress condition to which a plant cell has been exposed, comprising in the plant cell with an array or probes representative of the plant cell genome; and plant cell with an array or probes representative of the plant cell genome; and notice as stress response. The method is useful in the production of transgenic plants, cells and seeds and in producing plants broduction of transgenic plants, cells and seeds and in producing plants with increased tolerance to abiotic stress. The present sequence is that on a Arabidopsis thaliana stress regulated gene (ABZ12196-ABZ17574) used not a Arabidopsis thaliana stress regulated gene (ABZ12196-ABZ17574) used specification but is based on sequence information supplied to Derwent by the European Patent Office.

genetic modification; gene, ss.

The invention relates to Arabidopsis thaliana nucleic acid sequences. The DNA sequences and the polypeptides they encode are useful for identifying homologous or related genes, for producing compositions that modulate the temperature of the polypeptides, for mapping functional capturesion or function of the polypeptides, for studying associated to physiological pathways, for genetic manipulation of cells, preferably plant cells, in screening assays of various plant strains that are capable of withstanding a particular disease or the strains that are capable of withstanding a particular disease or environmental stress, for enhancing or inhibiting production of cisynthetic products in plants and the sease resistance and stress are useful for introducing or improving disease resistance and stress collisions. Screening biologically active agents, such as plant cells and plants. Such as plant cells and plants is screening biologically active agents, such as functional agents, such as biosynthetic pathways of nutritional, commercial or medicinal value. Sequences ARSKOSSS-ARXASSS Tepresent Arabidopsis thaliana transgenic plant with enhanced disease resistance and enhanced traits of interest, as probes, and in diagnosis and screening purposes Claim 1; Page 158; 277pp; English.

New Arabidopsis thaliana nucleic acid, for identifying homologous genes, producing compositions that modulate the expression or function of its encoded protein, and mapping functional regions of a protein -

Claim 1; SEQ ID 615; 44pp; English.

The present invention describes an Arabidopsis thaliana nucleic acid (I) comprising a sequence capable of hybridising under stringent conditions to a sequence (Si) sealected from any one of the 399 sequences given in ABL93236 to ABL94234. (I) have insecticide and fungicide activities, and they can be used as protein expression modulators. (I) can be used in identifying homologous or related genes; in producing compositions that modulate the expression or function of their encoded proteins, mapping functional regions of the proteins, and in studying associated physiological pathways: (I) can also be used: (1) for the genetic manipulation of cells, particularly plant cells; (2) in screening assays of various plant strains to determine the strains that are best capable of various plant strains to determine the strains that are best capable of various plant strains to determine the strains that are best capable of various plant in disgenses or environmental stress; (3) for enhancing or inhibiting production of a biosynthetic product in a plant; (4) as probes in mapping and in diagnosis, in genetic modification and for some content of propersor of a biosynthetic production of consequence of the printed and (5) for generate ribozymes or as triple-stand forming oligonucleotides; and (5) for generating genetically modified transgenic organisms.

Whose: The sequence data for this patent, did not form part of the printed usper of the printed usper one steed the specification, but was obtained in electronic form at directly from the

ring series

Determining the degree of cytosine methylation in genomic DNA, useful for diagnosis and prognosis, comprises selective hybridization of amplicons from chemically treated DNA

Claim 12; 56pp + Sequence Listing; 56pp; German

This invention describes a novel method for determining the degree of methylation of a particular cytosine in a motif 5'-CpG-3', present in a genomic sample of DNA. The sample is treated chemically to convert cytosine (C) but not methylated (C, to uracil, then part of the genomic DNA that contains the target C is amplified to form a labeled amplicon. The amplicon is hybridised to two classes, each with at least one member, of oligonuclectides and/or peptide-nucleic acid (PNA) cligoners and the degree of hybridisation to both classes is determined from the label on the amplicon, then the ratio of labels hybridised to the two classes of oligoners, the degree of methylation is calculated. The method is used: (1) for diagnosis and/or prognosis of side effects of therapeutic drugs and of a wide range of diseases, e.g. cancer, disorders of the central nervous, cardiovaccular, gastrointestinal and respiratory systems etc., particularly by detecting mutations or single nucleocide

```
This invention describes a novel method for determining the degree of methylation of a particular cytosine in a motif 5'-CpG-3', present in a genomic sample of DNA. The sample is treated chemically to convert cytosine (C) but not methylated C. to uracial, then part of the genomic DNA that contains the target C is amplified to form a labeled amplicon. The amplicon is hybridised to two classes, each with at least one member, of oligonucleotides and/or peptide-nucleic acid (PNA) oligomers and the degree of hybridisation to both classes is determined from the label on the amplicon. From the ratio of labels hybridised to the two classes of oligomers, the degree of methylation is calculated. The method is used: (i) for dagnosis and/or prognosis of side effects of themethod is used: (i) for dagnosis and/or prognosis of side effects of themethod is used: (i) for dagnosis and/or prognosis of side effects of the method is used: (i) for dagnosis and/or prognosis of side effects of collior respective confinement of systems etc., particularly by detecting mutations or single nucleotide polymorphisms (SNP's), and (ii) for differentiation of cell or tissue
        types and for investigating cell differentiation. The method allows the methylation status of many C residues to be determined simultaneously. ABQ13410-ABQ5411 represent genomic DNA sequences used to illustrate the method for determining the degree of cytosine methylation described in the disclosure of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Determining the degree of cytosine methylation in genomic DNA, useful for diagnosis and prognosis; comprises selective hybridization of amplicons from chemically treated DNA -

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Sequences ABB10981-ABB12330 represent 1350 novel human polypeptides, and sequences ABA08225-ABA09574 represent nucleic acids encoding them. The invention also relates to vectors and recombinant host cells comprising a nucleotide of the invention, methods of producing the novel polypeptides, antibodies against the polypeptides, methods of detecting the nucleotides or polypeptides in a sample, and methods of identifying compounds which bind to polypeptides of the invention. Although novel, many of the polypeptides of the invention have homology to known proteins, thereby giving an insight into their probable biological activities, and hence potential therapeutic applications. The polypeptides of the invention may
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Human; cytokine; cell proliferation; cell differentiation; growth factor;
ABQ13410-ABQ54121 represent genomic DNA sequences used to illustrate the method for determining the degree of cytosine methylation described in the disclosure of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              haematopoises regulation; tissue growth; immunomodulator; activin; inhibin; chemctaxis; chemckinesis; thrombolysis; oncogenesis; proliferation; metastessis; cancer; tumour; haematopoietic disorder; myeloid call disorder; lymphoid cell disorder; asthma; arthritis; chronic inflammatory condition; proliferative retinopathy; atherosclerosis; coronary heart disease; arterial ischaemia; bone disorder; osteoporosis; vascular growth disorder; cell culture; drug screening; gene therapy; antinflammatory; antiathritic; haemostatic; antiathritic; haemostatic; antiathritic; haemostatic; antiathritic; asteoporosis; cardiant; virucide; antibacterial; antifungal; vulnerary; antiulcer; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Human proteins and DNA encoding sequences useful for preventing, treating or ameliorating a medical condition in a mammalian subject e.g. arthritis and cancer -

the control activities, including cytokine, cell proliferation or cell differentiation activities stem cell growth factor activity; immunomodulatory activity; activing respect activity; activing activity; activing activity; activing activity; activing activities activities, activity; activing activities, thrombotic or thrombotic or chemokinetic activities; haemostatic, thrombotic or thrombotic or activities; activities; normal because the involved in oncogenesis, cancer cell proliferation or metastasis.

Completed in oncogenesis, cancer cell proliferation or metastasis or manipulation are useful for preventing, treating or ameliorating medical conditions, e.g., by protein or gene therapy; Such conditions include cancers, haematopoletic disorders (e.g., myeloid or lymphoid cell conditions, e.g., by protein or gene therapy; Such conditions include cancers, baematopoletic disorders (e.g., myeloid or lymphoid cell disorders), chronic inflammatory conditions (e.g., asthma or arthritis), proliferative retinopathy, atherosclerosis, coronary heart disease, arterial ischaemia, bone disorders (e.g., osseoporosis), and abnormal vascular growth. Polypeptides involved with tissue regeneration and carefal infections and ulcers), while those with immunomodulatory activities may be used to promote even cell growth. For example, such polypeptides may be used to promote cell growth. For example, such polypeptides may be used to used to culture to give rise to neurospithalial cells that can be used to augment or replace cells damaged by illness, and indicing and also be used to the above conditions, and indicing and indicing and also be used to be augment or replace cells damaged by illness, and indicing and also be used to the above conditions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                screening techniques. The present sequence represents a cDNA encoding novel human polypeptide of the invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           This invention describes a novel method for determining the degree of methylation of a particular cytosine in a motif 5'-CpG-3', present in a genomic sample of DNA. The sample is treated chemically to convert cytosine (C) but not methylated C, to uracil, then part of the genomic DNA that contains the target C is amplified to form a labeled amplicon. The amplicon is hybridised to two classes, each with at least one member, of oligonucleotides and/or peptide-nucleic acid (PNA) oligomers and the degree of hybridisation to both classes is determined from the label on the amplicon. From the tratic of labels hybridised to the two classes of oligomers, the degree of methylation is calculated. The metho
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Determining the degree of cytosine methylation in genomic DNA, useful for diagnosis and prognosis, comprises selective hybridization of amplicons from chemically treated DNA

Berlin K,

Determining the degree of cytosine methylation in genomic DNA, useful for diagnosis and prognosis, comprises selective hybridization of amplicons from chemically treated DNA

Claim 12; 56pp + Sequence Listing; 56pp; German.

This invention describes a novel method for determining the degree of methylation of a particular cytosine in a motif 5'-CpG-3', present in a genomic sample of DNA. The sample is treated chemically to convert cytosine (C) but not methylated C, to uracil, then part of the genomic DNA that contains the target C is amplified to form a labeled amplicon. The amplicon is hybridised to two classes, each with at least one member, of oligonucleotides and/or peptide-nucleic acid (PNA) oligomers and the degree of hybridisation to both classes is determined from the label on the amplicon. From the ratio of labels hybridised to the two lasses of oligomers, the degree of methylation is calculated. The method is used: (i) for diagnosis and/or prognosis of side effects of the reapentic drugs and of a wide range of diseases, e.g. cancer, disorders of the central nervous, cardiovascular, gastrointestinal and respiratory

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention comprises the amino acid and coding sequences of human secretory (SPTM) proteins. The SPTM DNA and amino acid sequences are useful for treating a disease or condition associated with the expression of functional SPTM. The SPTM DNA sequences are useful for somatic or germline gene therapy to correct a genetic deficiency (e.g. severe combined immunodeficiency). The SPTM DNA sequences are also useful in parasites and protozoan parasites). The SPTM DNA and protein sequences are also useful for diagnosing cell proliferative disorders, cancer, immune disorders (e.g. fungal parasites and protozoan parasites). The SPTM DNA and protein sequences are also useful for diagnosing cell proliferative disorders, cancer, disease), metro neuron disorders, demyelinating diseases (e.g. multiple sclerosis), meningitis, abscesses, prion diseases, cerebral palsy, neurosystelad disorders, party myasthemia gravis, and mental disorders (e.g. Tourette's syndrome). CDNA sequences ABL999229 represent human secretory polynucleotides of the invention.
                                                                                                                                                                               Stuart J, Lincoln SE, Altus CM, Dufour GE, Chalup MS, Hillman JL, Jones AL, Yu JY, Wright RJ, Gietzen D, Liu TF, Yap PE, Dahl CR; Momiyama MG, Bradley DL, Rohatgi SD, Harris B, Roseberry AM; Peralta CH, David MH, Panzer SR, Flores V, Daffo A; Marwaha R, Chen AJ, Chang SC, Au AP, Inman RR;
                                                                                                                                                                                                                                                                                                                                                                                                                                                Polynucleotide sequences encoding human secretory proteins useful for gene therapy of e.g. genetic deficiency disorders, cancers, and diseases caused by intracellular parasites

The invention comprises the amino acid and coding sequences of human secretory (SPTM) proteins. The SPTM DNA and amino acid sequences are useful for treating a disease or condition associated with the expression of functional SPTM. The SPTM DNA sequences are useful for somatic or germline gene therapy to correct a genetic deficiency (e.g. severe combined immunodeficiency). The SPTM DNA sequences are also useful in parasites and protoccan parasites). The SPTM DNA and protein sequences are also useful in parasites and protoccan parasites). The SPTM DNA and protein sequences are also useful for diagnosing cell proliferative disorders, cancer, immune disorders (e.g. AIDS), neurological disorders (e.g. Fungal sclesses), motor neuron disorders, demyelinating diseases (e.g. multiple sclerosis), meningitis, abscesses, prior diseases (e.g. multiple sclerosis), and polymyositis, myosethenia gravis, and mental disorders (e.g. Tourette's syndrome). CDNA sequences ABL99229
                                                                                                                                                                                                                                                                                                                                                                                              Hillman JL;

The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention is useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher enkaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention addiscloses genomic DNA sequences (ABLi6176-ABL30511), expressed DNA sequences (ABLi6175) and the encoded proteins
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signalling and cell-cell interactions -
Drosophila melanogaster expressed polynucleotide SEQ ID NO 37076.

An Arabidopals full-length CDNA library was constructed essentially as reported previously (Seki et al., 1998).cDNA cleaved with BamHI and XhoI was ligated to modified Lambda FLC-1 vector (Carninci et al., submitted for publication) digested with BamHI and SalI. This clone is in a modified Daluescript vector. Please visit our web site (http://www.gsc.riken.go.jp/e/plant/index _e.html) for further
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   378 bp mRNA linear BST 19-MAR-2001

// note=""Vector: lambda Zip-Lox; Site_1: Sal; Site_2: Not; lambda PRL2 is a cDNA library derived from equal quantities of 4 pools of mRNA. The maxNA sources were 1) 7 day germinated etiolated seedlings; 2) tissue culture grown roots; 3) staged plants half with 24 hour light cycle, half on 16 hr light, 8 hour dark- rosettes; 4) same plants as 3 but aerial tissue (stems, flowers and siliques. The vector is BRL's lambda Zip-Lox. The cDNA inserts were directionally cloned with Sal-Not arms using oligo dT primed cDNA. " 13 others
